SUMO: SUGarbeet MOdel for predicting yield and quality

A.C.P.M. van Swaaij, L.M. Withagen, (IRS)
T. Schiphouwer (Suiker Unie)
and A.B. Smit (WUR)

Yield and quality forecast

- ☀ present yield forecast 2003
- ☀ history of yield forecast
- ☀ *SUMO*: estimations
- ☀ *SUMO*: factors determining yield and quality
- ☀ *SUMO*: results
- ☀ conclusions

Average yield forecast The Netherlands 2003 Based on *SUMO*

present forecast

date	root yield (t/ha)	sugar yield (t/ha)
28-07	68	11.0
11-08	69	11.2
25-08	66	10.7
08-09	66	10.7
final yield 2002	60	9.6
final yield 1993-2002	58	9.3

- 1 = Zeeuwsch-Vlaanderen
- 2 = Zeeuwse Eilanden
- 3 = West-Brabant
- 4 = Noord- en Zuid-Holland
- 5 = Oost- en Zuid-Flevoland
- 6 = Noordoostpolder
- 7 = Noordelijk klei
- 8 = Noordelijk zand
- 9 = Noordelijk dal
- 10 = Gelderland e.o.
- 11 = Oost-Brabant
- 12 = Limburg

Yield forecast individual regions 2003

Based on *SUMO*

Region No. Name	Root yield (t/ha)	Sugar yield (t/ha)
1 = Zeeuwsch-Vlaanderen	65	10.8
2 = Zeeuwse Eilanden	67	11.0
3 = West-Brabant	66	10.8
4 = Noord- en Zuid-Holland	72	11.6
5 = Oost- en Zuid-Flevoland	84	13.3
6 = Noordoostpolder	81	13.3
7 = Noordelijk klei	72	11.6
8 = Noordelijk zand	53	8.8
9 = Noordelijk dal	57	9.4
10 = Gelderland e.o.	59	9.3
11 = Oost-Brabant	58	9.2
12 = Limburg	65	10.1
Netherlands	66	10.7

☀ until 1995: periodic harvests

- 1 sampling site per 100 – 400 ha
- 4 - 10 samplings/year

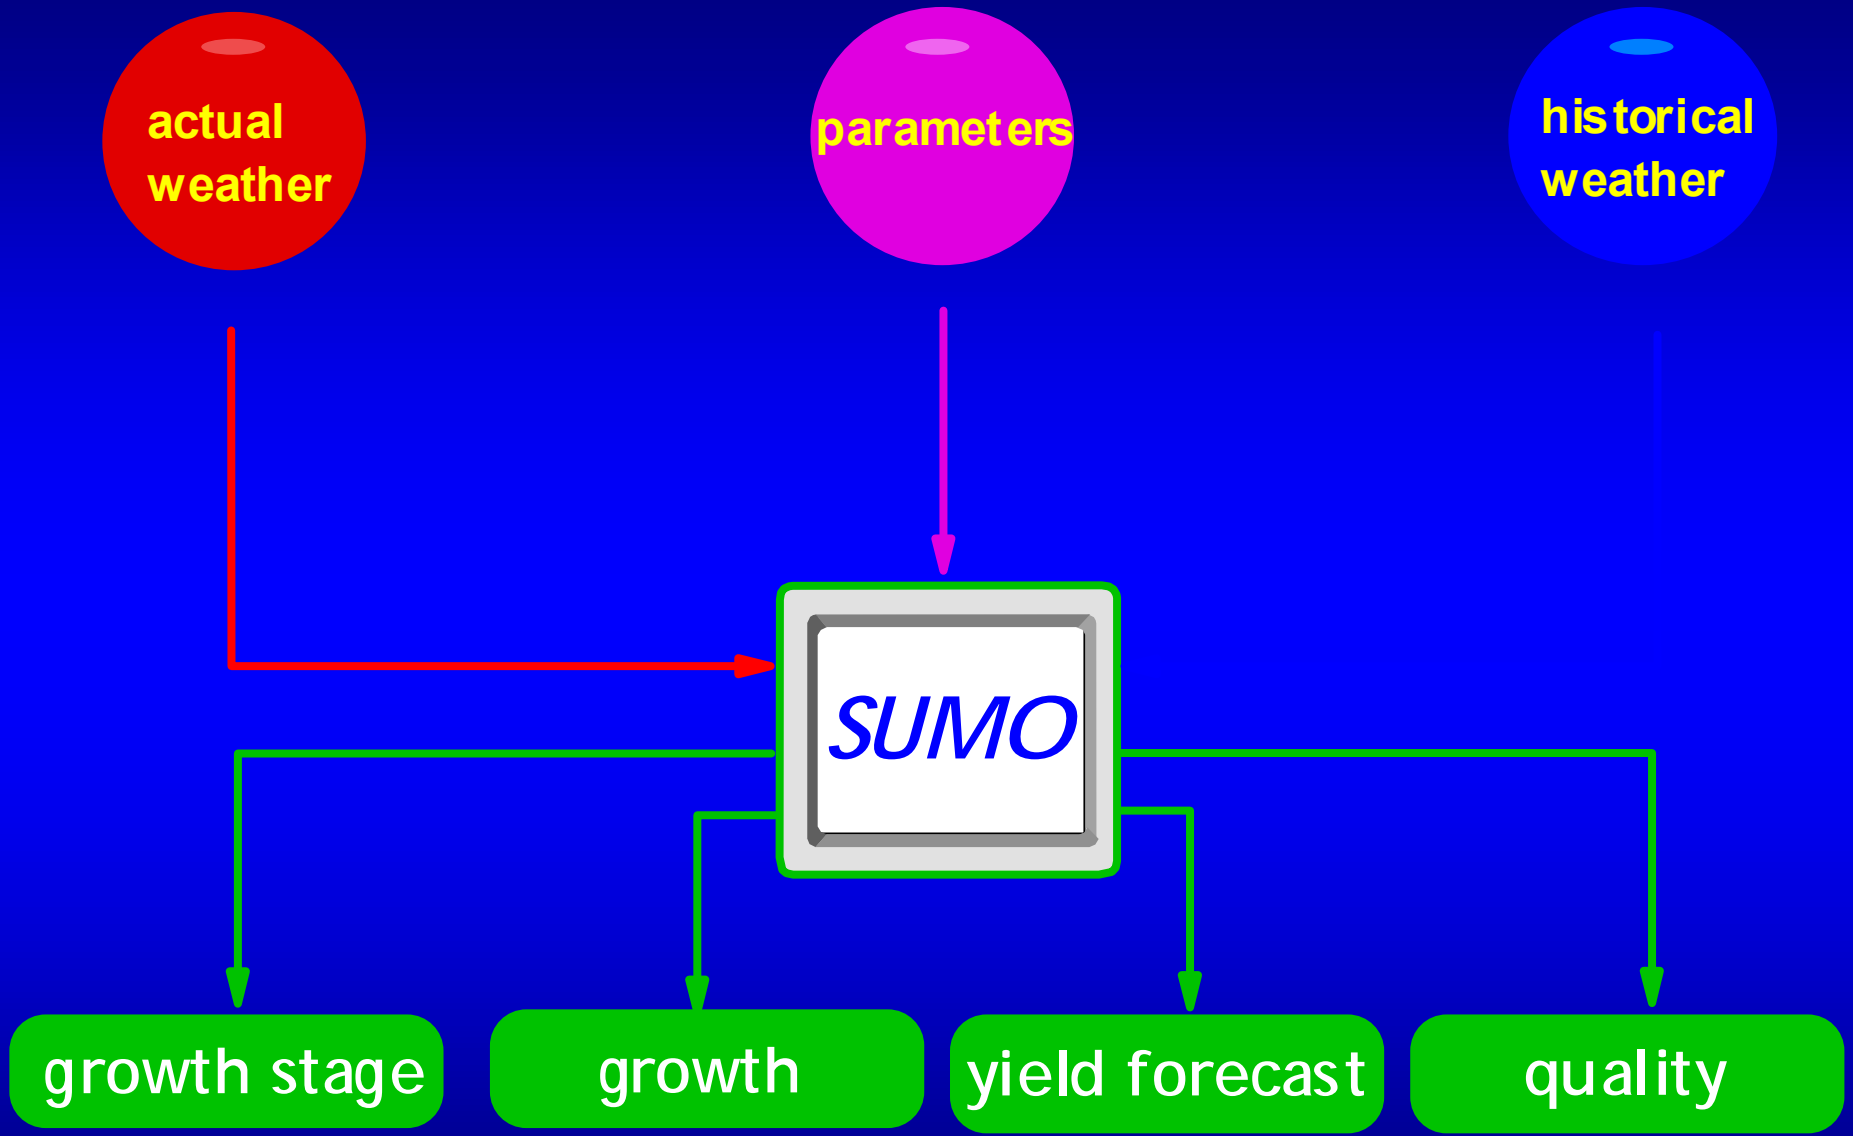

☀ growth models

- WUR: scientific model
- Suikerunie: applied model

☀ *SUMO*

- synthesis between applied and scientific
- calibration: yield and weather data 1981-1986
- Oracle database; start in 1996
- national forecast without additional sampling

estimations

driving factors:

adjusting factors:

drilling date

temperature

moisture*

growth point date

irradiation

variety,
plant number,
temperature

potential growth

moisture*

actual growth

harvest,
transport,
storage and
other losses

final yield

Level 3

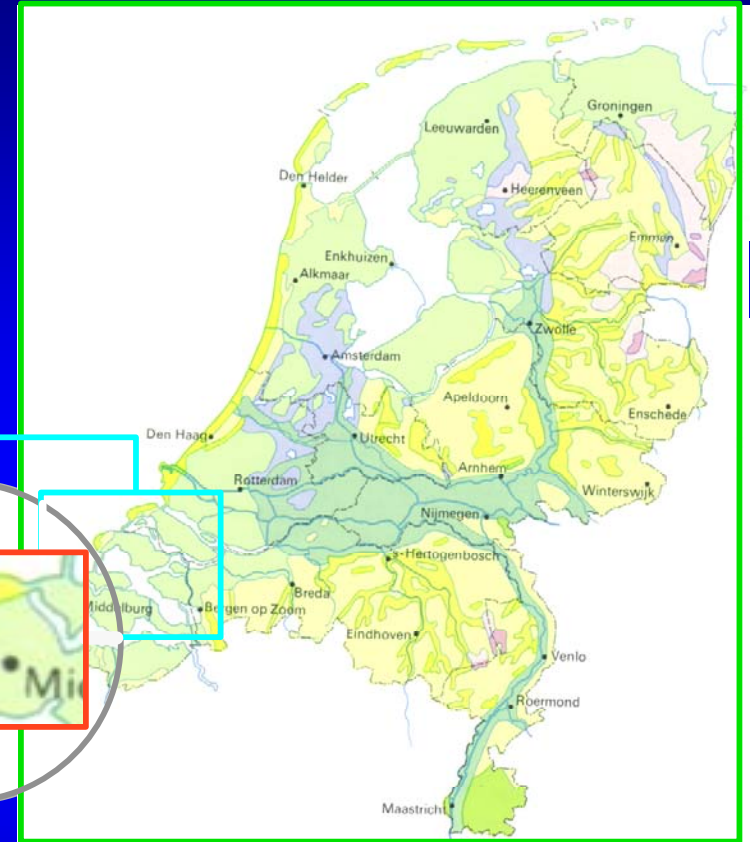

- acreage
- soil conditions
- moisture balance
- % drought susceptible
- % irrigation

Level 2

- sowing date
- temperature sum required
- growth coefficient
- reduction factors
variety, plant number
- regression coefficient yield

Level 1

- quality

Quality forecast

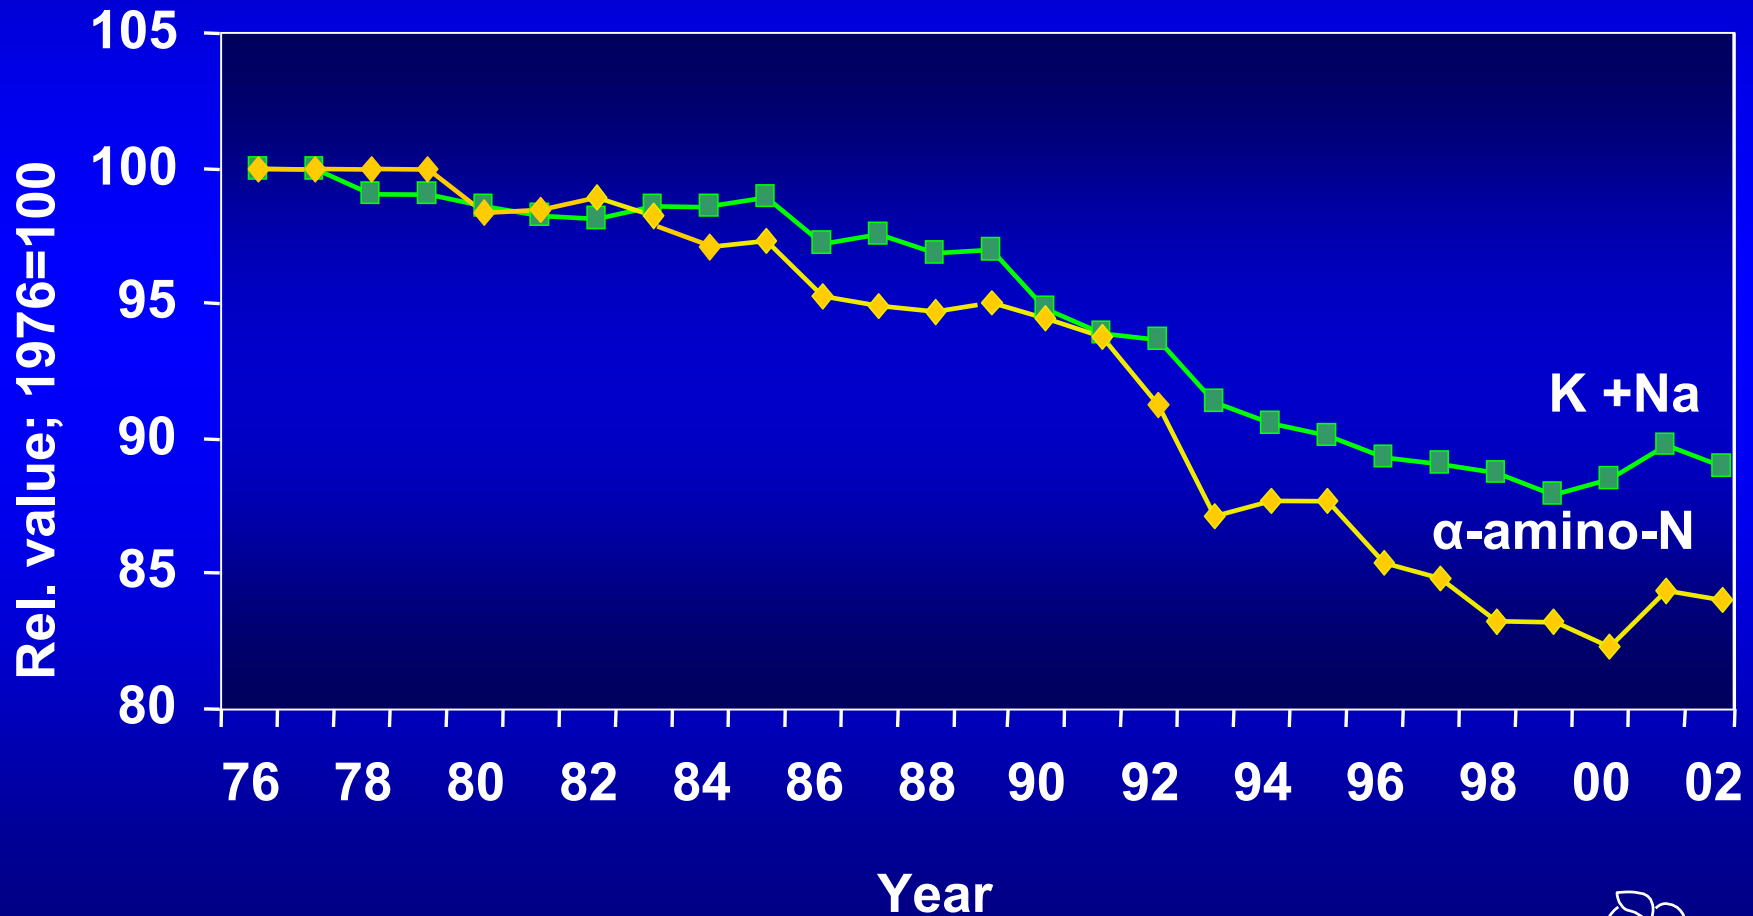

- ☀ extractability sugar and molasses
- ☀ average of the Netherlands

$$K+Na = a \times DCC + b \times \text{Precipitation}^1 + c \times \text{Variety factor} + d$$

$$\alpha\text{-amino N} = e \times \text{Precipitation}^2 + f \times \text{Temperature} + g \times \text{Variety factor} + h$$

Quality and variety

Quality improvement of sugar beet varieties, 1976 – 2002
(values adjusted for year effects)

Sowing date

sowing date	root yield (t/ha)	sugar yield (t/ha)
March 1	61,1	9,6
March 15	60,5	9,6
March 31	58,3	9,2
April 15	55,4	8,8
April 30	51,4	8,3
May 15	45,4	7,4

Temperature I

Temperature sum to date of closed canopy:

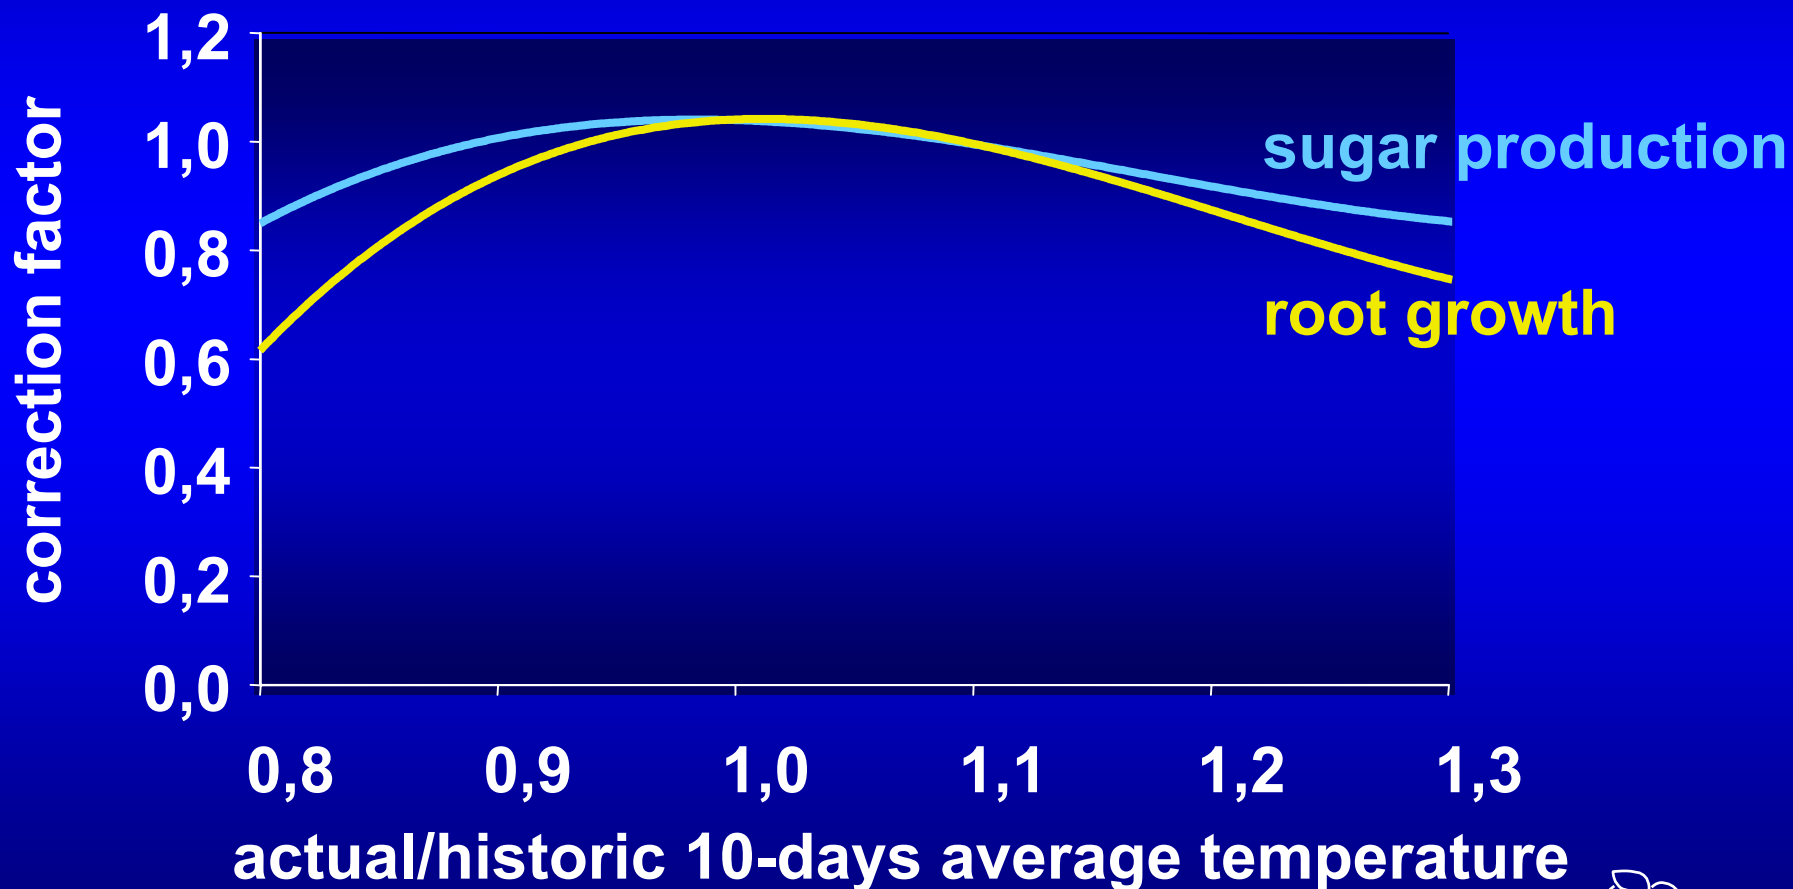

Polders 590° . days

Holland 611° . days

Northern sand 641° . days

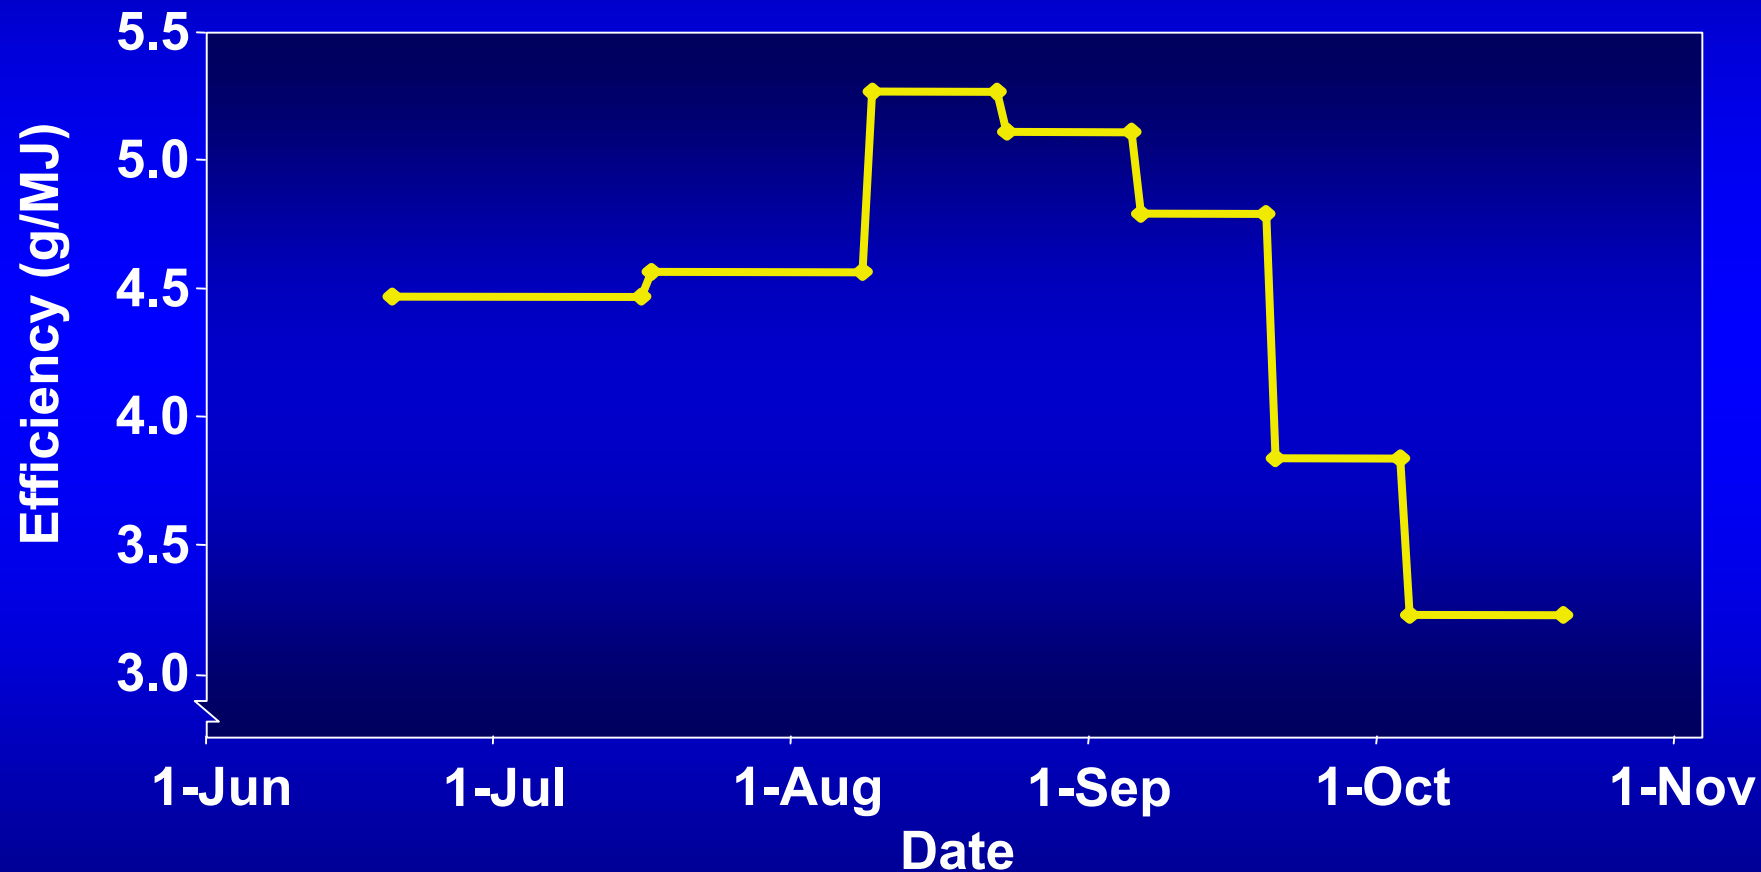

Temperature II

Effect of average daily temperature during summer

Radiation I

Radiation Use Efficiency of root production

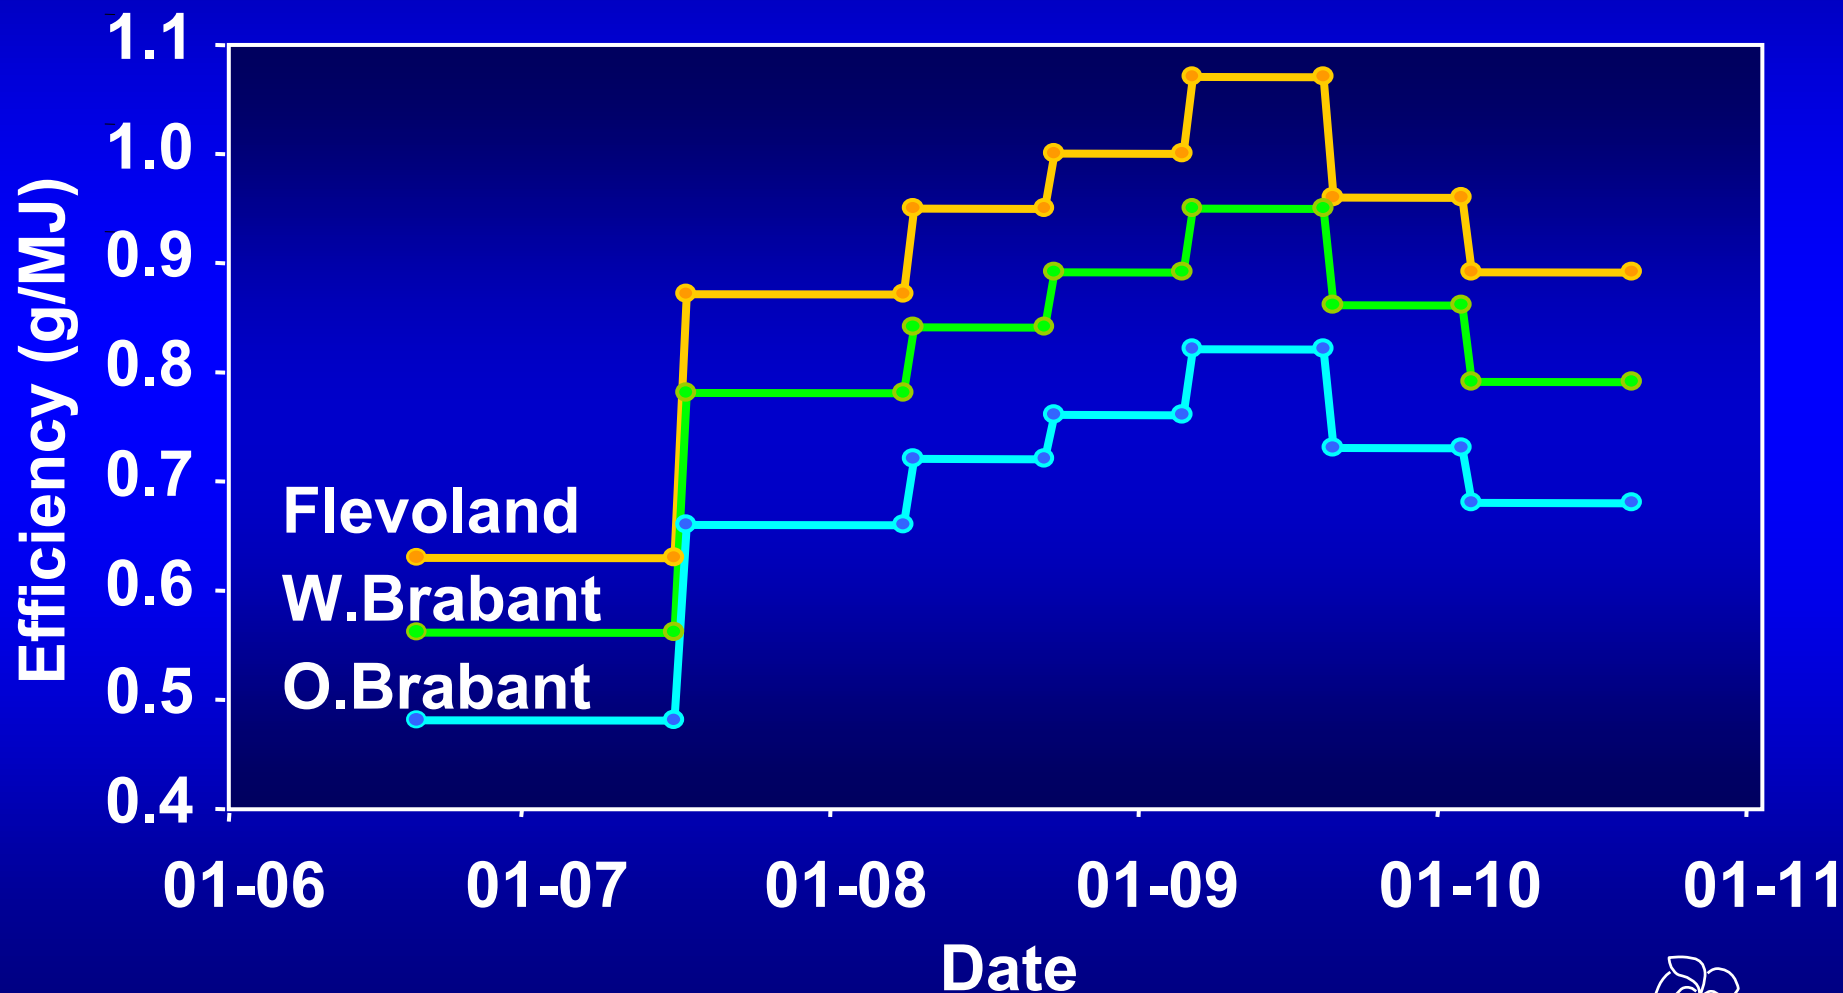

Radiation II

Radiation Use Efficiency of sugar production

Radiation III

Radiation Use Efficiency of sugar production,
difference between areas

Variety

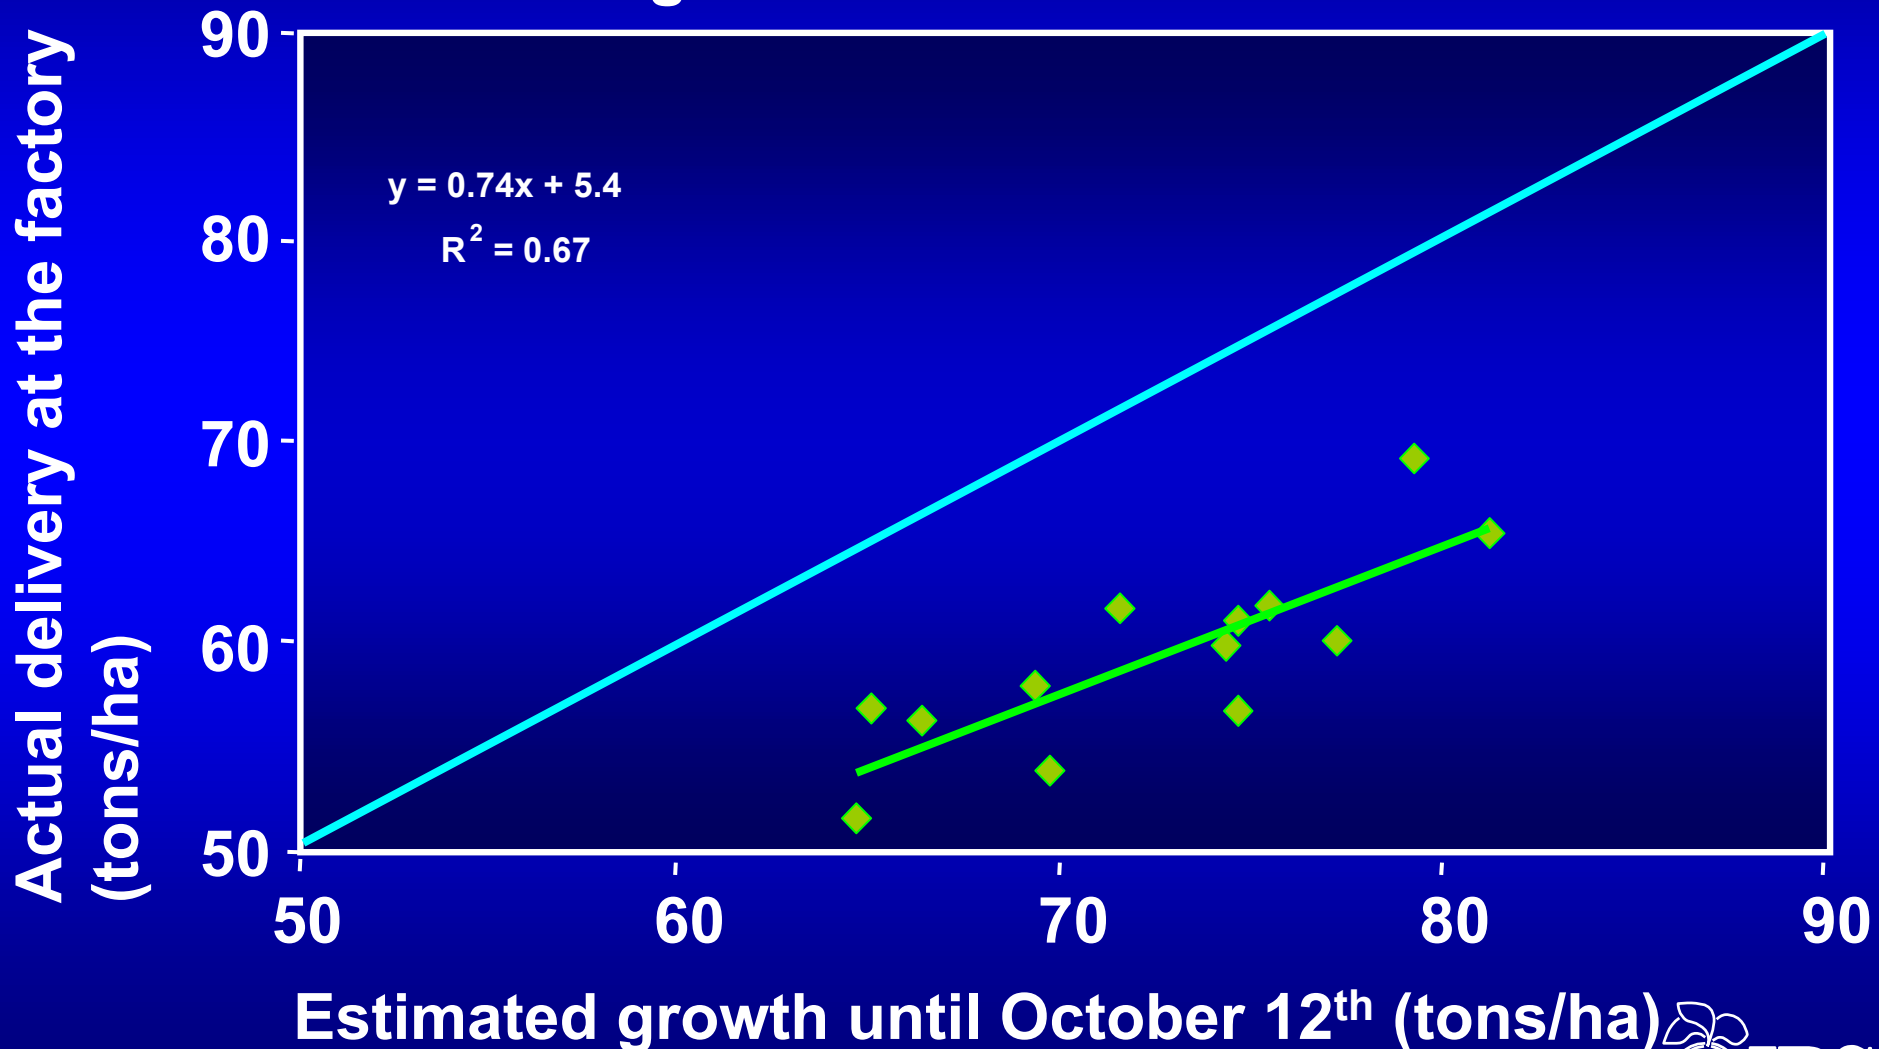

- ☀ use of varieties with high sugar content
- ☀ use of resistant varieties with lower yield potential

Moisture

Harvest losses

Estimated growth and final harvest 1990-2002

Not included in *SUMO*

- ☀ pests and diseases
- ☀ soil structure
- ☀ fertilization
- ☀ resistant varieties
- ☀ extreme weather conditions

These are partly covered by overall regressions over the years.

Mid-August sugar yield predictions (tons/ha)

Year	prediction		realized yield	difference prediction - realised	
	<i>SUMO</i>	sampling		<i>SUMO</i>	sampling
average 1989-1995	9.6	9.8	9.6	0.4	0.4
1996	9.1		9.3	0.2	
1997	9.6		9.5	0.1	
1998	9.1		8.0	1.1	
1999	9.4		9.8	0.4	
2000	10.0		9.8	0.2	
2001	9.0		9.1	0.1	
2002	10.1		9.6	0.5	
average 1996-2002	9.5		9.3	0.4	

- ✓ forecast *SUMO* or sampling
→ same precision
- ✓ *SUMO*: input required is minimal
- ✓ extreme conditions or diseases
are not included
